## Author Institution Codes and Addresses

Some items in Mathematical Reviews and Current Mathematical Publications (CMP) include author institution address codes. An institution code consists of three parts separated by hyphens; these parts designate the country, the university or institution, and the department. For six countries the country designation consists of a single digit. These codes and countries are 1- USA, 2- USSR, 3- Canada, 4- United Kingdom, 5- Australia and 6- India. The absence of a department code indicates Department of Mathematics. It is not feasible to code all institutions, and a code is assigned only for articles which have an author address coinciding with one of the institutions we have coded. A cumulative supplement to this list appears in each issue of CMP. A revised list is planned for the 1986 annual index.

## TRANSLITERATION OF CYRILIC

Since 1983 Mathematical Reviews (MR) and the American Mathematical Society use the system for transliteration (romanization) of Cyrillic given below. This system is largely in agreement with other transliteration systems in use in the U.S.A., such as those of the American National Standards Institute (ANSI), the U.S. Library of Congress (LC), and the Institute for Scientific Information (ISI). The principal feature of these systems is that they are intended to be as phonetic as possible for speakers of English.

The table below lists all Cyrillic letters occurring in Slavic languages, and the transliteration schemes used by:

Mathematical Reviews (= MR) (new),  
Zentralblatt für Mathematik (= Zbl) (new),  
MR and Zbl (old),  
American National Standards Institute (= ANSI),  
U.S. Library of Congress (= LC),  
Institute for Scientific Information (= ISI).

The transliteration of the British Standards Institute (= BSI) agrees with that of ISI, except for the letters  $\ddot{e}$  and  $\ddot{a}$   $\mapsto$   $\dot{e}$ .

In the schemes of some of these enterprises, a few Cyrillic letters receive more than one transliteration, depending on the language in which the letter occurs. Non-Russian Cyrillic letters and transliterations different from the one for Russian are identified by superscript numbers:

- 1 Ukrainian
- 2 Belorussian
- 3 Serbian
- 4 Macedonian
- 5 Bulgarian.

In order to achieve complete reversibility of the transliteration scheme, centered dots are used as a separating or bracketing device, in the following cases:

$\tau\epsilon \mapsto t\cdot s$ ,  $\tau\dot{\text{ш}} \mapsto t\cdot sh$ ,  $\text{ш}\dot{\text{ч}} \mapsto sh\cdot ch$ ,  $\text{ы}\dot{\text{у}} \mapsto y\cdot u$ ,  $\text{я}\dot{\text{а}} \mapsto y\cdot a$ ,  $\text{д}\dot{\text{ж}} \mapsto d\cdot j$ ,  
 $\text{л}\dot{\text{ж}} \mapsto l\cdot j$ ,  $\text{н}\dot{\text{ж}} \mapsto n\cdot j$ , for separation, and  $\text{ш}\dot{\text{ш}} \mapsto dz\cdot h$  for bracketing.

Alphabetization (in indexes, etc.) takes place following the "stripped" version (i.e., without diacritical marks) of the transliteration; the symbol " (double prime) representing  $\text{ъ}$  is kept in the stripped version and placed at the head of the alphabet (the single prime representing  $\text{ь}$  is ignored). The capital version of the Bulgarian " is distinguished by an underbar: " .

## ERRATA AND ADDENDA

### 30 #2063: Pazderski, Gerhard

### 84a:57020: Luukkainen, J.; Tukia, P.

### 84h:05028: Lam, C. W. H.; Thiel, L.; Swiercz, S.; McKay, J.

The following should replace the original review:

It is well known that if a projective plane of order 10 with an oval (= hyperoval) exists, then a partial geometry  $pg(6, 9, 4)$  exists. Such a partial geometry can be described by taking pairs from  $N := \{1, 2, \dots, 12\}$  as lines and a suitable set of 99 partitions of  $N$  into six pairs as points, where a point is on a line if the pair occurs in the partition. By an exhaustive backtrack search, which took 183 days of computing on a VAX 11/780, it was shown that such a set of partitions does not exist. This note gives a brief indication of the methods (two different programs were used). A copy of the program is available from the authors on request. The nonexistence of the partial geometry implies that a projective plan of order 10, if one exists, does not have an oval. It is also well known that this implies that a plane of order 10 does not have an extension to a 3-design.

The following is the review text:

A first countable Hausdorff space on which there exists no strictly weaker first countable Hausdorff topology is said to be minimal first countable Hausdorff. The authors investigate several closely related properties, such as  $\alpha$ -minimal  $E_1$  spaces and  $\beta$ -minimal  $E_1$  spaces. By an  $E_1$  space [C. E. Aull, *Prace Mat.* **11** (1968), 49-53; MR **37** #3498] one means a space in which every point is the intersection of its closed neighborhoods. An  $E_1$  space is said to be  $\alpha$ -minimal  $E_1$  provided that for every closed

subset  $A$  of  $X$  and countable open cover of  $A$ , there exists a finite subcollection of the cover such that the closure of its union contains  $A$ . The authors characterize  $\alpha$ -minimal  $E_1$  spaces and  $\beta$ -minimal  $E_1$  spaces, and several examples are given.

The following is the review text:

A space  $X$  is said to be angelic if for every relatively countably compact subset  $A$  of  $X$ , (a)  $A$  is relatively compact, and (b) if  $x \in \bar{A}$ , then there is a sequence in  $A$  converging to  $x$ .  $X$  is said to be strictly angelic if (1) every relatively countably compact subset of  $X$  is relatively compact, (2) for every relatively compact subset  $A$  of  $X$  and  $x \in \bar{A}$ , there is a countable subset  $D$  of  $A$  such that  $x \in \bar{D}$ , and (3) all separable compact subsets of  $X$  are first countable. The author lists six problems concerning angelic and strictly angelic spaces.

Replace the text with the following:

Let  $G$  be a 3-connected graph without loops but which may be infinite and possess multiple edges. Let  $\varphi$  be a bijection of  $E(G)$  onto the edge set of another graph  $H$  without isolated vertices. Assume that under  $\varphi$  the 3-skeins of  $G$  and  $H$  correspond to each other (i.e.  $\varphi$  is a 3-skein isomorphism). Then it is proved that  $\varphi$  is induced by an isomorphism of  $G$  and  $H$ .

**85h:01006: Sesiano, Jacques**

It is to be pointed out that Sesiano's book is an extended version of a Ph.D. thesis accepted at Brown University in 1975. Questions of the possible dependence of Sesiano's work on that of Rashed were discussed in detail in a review of Sesiano's book by J. P. Hogendijk [Historia

Math. 12 (1985), 82-85]. It now seems apparent to the editors that the review in MR was unbalanced and grossly unfair to the author.
